# Oil Watch Monitor

## Never Run Out Of Oil Again!

Home and business owners in the country, who heat their home or business with oil, are faced with the never-ending fear of running out of oil during the heating season. Antron Engineering has developed a monitoring device that is easily installed over the site glass located on the top of the fuel tank (no tools required). This monitor can be set at various settings by the home or business owner, to assure confidence of knowing when the level of fuel has reached a predetermined safe level to have the tank refueled. An audible alarm that will sound for a minimum of 200 hours, which allows the home or business owner enough time to have the tank refueled before any damage or loss of income.

The battery-operated device is designed to monitor your oil tank during the entire heating season. Batteries must be replaced at the beginning of each heating season and should be replaced if the owner knows that the alarm has sounded for an extended period of time.

This is a very inexpensive way to have your home or business monitored that is easily installed and maintained. This device serves as a valuable tool in homes, manufacturing plants, storage facilities, warehouses, retail stores, grocery stores, public and private schools, hospitals and nursing homes. Damage done by freezing pipes costs thousands of dollars to repair or replace, causing extensive damage to existing inventory, and loss of business and income.
